Subject's extra information

We recommend attendance and resolution of proposed problems.

Case studies should be solved as soon as possible, it is not advisable to leave them to the last minute.

Consulting bibliography is an essential requirement for the subject.

Students must achieve a level of knowledge that allows the calculation of structural and mechanical parts to achieve capacity enough to select the most appropriate design criteria for optimum performance of each piece.

It aims to establish a foundation of calculation knowledge that will be needed in other areas such as in the case of structural design, mechanical, etc.

Learning objectives

- Apply energy theorems in structural calculation.

- Calculate isostatic pinned structures.

- Calculate hyperstatic pinned structures.

- Get inner forces in pinned with pillar structures.

- Working with elastic solids and get its stress in a analytical and graphical way.

- Obtain deformations in elastic solids and relate them with stress.

Competences

Degree-specific competences

- Knowledge and ability to apply the principles of elasticity and resistance of materials to the behaviour of real solids.

  Goals

  - Students must be able to address real problems and propose simplifications to them, within the field of strength of materials

- Knowledge and ability for calculus, structural design and industrial constructions.

  Goals

  - Students must be able to calculate a structure and decide what kind of links are the best to the design system selected

Degree-transversal competences

- Ability to gather and interpret relevant data in their field of study, and to emit judgements that include a reflection on relevant themes of a social, scientific or ethical nature

  Goals

  - Students must be able to comprehend data of problems and results

- Ability to resolve problems and elaborate and defend arguments inside their field of study

  Goals

  - The student must learn to propose and decide the order to follow for solving problems and real cases

- Ability to analyse and synthesize.

  Goals

  - Students must be able to organize the results of the calculations and choose the relevant ones
  -

Subject contents

1. - Strength of materials. Introduction. Internal forces.

2.-Systems of pinned bars. Isostatics

3.-Systems of pinned bars. Statically indeterminate.

4.-Systems of pinned bars. Mixed Systems with embedded pillars.

5. - The mechanic prism. Stress.

6. - The mechanic prism. Deformations.

7. - Relationship between stress and strain.

8. - Theory of the inner potential.

Methodology

* Lectures: Before beginning with the problems a theoretical introduction to each chapter of the course will take place.

* Problems: The main focus of the course is to learn to solve problems of strength of materials and structural design. After the theoretical introduction will arise and solve different kind of problems. Problems are conducted in small groups.

* Exercises to deliver: Students also have to solve problems individually or in groups. The problems solved and delivered in class will be used in the calculation of the final mark for the subject. These exercises will be conducted in small groups.

* Case Studies: At the end of each chapter, a case studie will be required. Students will submit a final report with all of them. This case is different for each student as data depends on the student identification number. This report will also have an important weight in the mark of the subject.

Development plan

Week	Chapters	Classroom working hours	Freelance working hours
1-2	Chapter 1	8	12
3-5	Chapter 2-3	12	18
6-7	Chapter 4	8	12
8-10	Chapter 5	12	18
11-12	Chapter 6	8	12
13-14	Chapter 7	8	12
15	Chapter 8	4	6

Evaluation

Exams: 80% (2 partial 40%)

Case Studies: 10%

Teory and problems test: 10%

****

Máximum mark in second chance exam: 6

Alternative evaluation: 80% two partial exams + 20% one exercise from each chapter with the tool of the virtual campus.
