

Universitat de Lleida

GUÍA DOCENTE **PROTEÓMICA E INGENIERÍA DE PROTEÍNAS**

Coordinación: TAMARIT SUMALLA, JORDI

Año académico 2020-21

Información general de la asignatura

Denominación	PROTEÓMICA E INGENIERÍA DE PROTEÍNAS				
Código	101652				
Semestre de impartición	2o Q(SEMESTRE) EVALUACIÓN CONTINUADA				
Carácter	Grado/Máster		Curso	Carácter	Modalidad
	Grado en Ciencias Biomédicas		2	OBLIGATORIA	Presencial
Número de créditos de la asignatura (ECTS)	6				
Tipo de actividad, créditos y grupos	Tipo de actividad	PRALAB	PRAULA		TEORIA
	Número de créditos	1.2	0.8	1	3
	Número de grupos	2	2	2	1
Coordinación	TAMARIT SUMALLA, JORDI				
Departamento/s	CIENCIAS MÉDICAS BÁSICAS				
Distribución carga docente entre la clase presencial y el trabajo autónomo del estudiante	Lectures, 60 hours. Avaluation, 4 hours. Stimated independent student work, 90 hours				
Información importante sobre tratamiento de datos	Consulte este enlace para obtener más información.				
Idioma/es de impartición	Catalán. Se requiere capacidad de leer textos científicos en inglés				

Profesor/a (es/as)	Dirección electrónica\nprofesor/a (es/as)	Créditos impartidos por el profesorado	Horario de tutoría/lugar
TAMARIT SUMALLA, JORDI	jordi.tamarit@udl.cat	9	

Objetivos académicos de la asignatura

Proteins are the executors of virtually all biological processes. Knowing its structure and function is key to understanding the functioning of biological systems. Also, proteins are not only a subject for study; they can also be used for medical or industrial purposes. Indeed, molecular biology allows us to modify the structure of the proteins in order to give them new functions that are useful in biotechnology or in medicine. These approaches are known as protein engineering. On the other hand, it should be noted that the focus we take to study biological systems has changed in recent years. Until the end of the 20th century, research in Biochemistry and Molecular Biology followed a reductionist approach, focusing on the individual characterization of the function and structure of genes and proteins. The ability to carry out large-scale DNA sequencing and the exponential increase in computing capacity, allowed starting a new revolution, the consequence of which is the ability to carry out global studies of biological systems. Today we can talk about Systems Biology, as an approach that aims to study biological systems in a holistic way. In this context, Proteomics is the branch of research that focuses its objectives on the systematic study of the levels of expression, post-translational modifications and the interactions that are established between proteins. In this subject the student will receive an up-to-date vision of the main tools that allow the study of the proteome and will learn to interpret and design experiments that lead to a greater understanding of the functioning of biological systems through the systematic study of their proteome

Contenidos fundamentales de la asignatura

Theory (30h)

Part I: Protein Chemistry and Engineering

1. Analysis of protein structure
2. Metalloproteins
3. Liquid Chromatography
4. Protein production and purification
5. Applications of protein engineering in biocatalysis and medicine

Part II: Proteomics

6. Protein electrophoresis
7. Principles of mass spectrometry of peptides and proteins
8. Gel free proteomics
9. Clinical proteomics
10. Analysis of protein interactions
11. Posttranslational modifications
12. Protein Arrays

Practical program (30 hours)

Informatics sessions (14h)

Activity I: protein sequence similarity searches and alignment using BLAST

Activity II: protein identification by mass spectrometry (peptide mass fingerprinting and MS/MS-Ion search)

Activity III: proteomic databases (Peptide Atlas and PaxDb)

Laboratory sessions (12h)
Spectrophotometry of proteins and aminoacids
Liquid Chromatography
Protein electrophoresis

Critical reading of scientific articles (4h)

Ejes metodológicos de la asignatura

To achieve the objectives and acquire the attributed competencies, the following methodology will be used:

- Theory: master classes

They have the purpose of giving an overview of thematic content, highlighting those aspects that will be useful in their training.

- Critical review of scientific articles.

Two scientific articles will be discussed. The seminars are intended for students to observe how to apply theoretical concepts to practice and to explore in depth the most relevant and most complex aspects of the subject

-Activities in computer classroom.

The students will carry out some activities with computer in order to apply and work some theoretical concepts

-Practical laboratory. .

The laboratory practices have the purpose to help the students to become familiar with some basic proteomics and protein chemistry techniques. They will be performed in groups of two or three students.

Plan de desarrollo de la asignatura

The following development plan will be used:

- Theory: master classes

These will be done with all the students and they are not compulsory.

- Critical review of scientific articles.

These will be done with 1/2 of the students. In them, scientific articles related to the topic of the subject will be analyzed.

-Activities in computer classroom.

These will be done with 1/2 of the students and they are compulsory.

-Practical laboratory. .

These will be done with 1/2 of the students, they are compulsory. Students who do not perform 90% of the practices will not be evaluated.

LABORATORY SAFETY RULES

In the script of each practice, the required individual protection equipment for each session will be indicated. This script will be available in the "Recursos" section of the virtual campus.

The general safety rules are as follows:

- Maintain the work place clean and tidy. The work table must be free of backpacks, folders, coats ...
- Bring closed and covered shoes during the performance of the practices.
- Keep the lab coat tied to protect against spills of chemical substances.
- Do not wear wide bracelets, pendants or sleeves that can be trapped by the equipment.
- Avoid wearing contact lenses, since the effect of chemicals is much greater if they are introduced between the contact lens and the cornea.
- Do not eat or drink in the laboratory
- Smoking is prohibited within laboratories
- Wash your hands whenever you have contact with a chemical and before leaving the laboratory.
- Follow the teacher's instructions and ask him any question you may have about security

Sistema de evaluación

Evaluation will consist of two partial examinations, the presentation of several practical exercises and oral presentations.

The details of how the assessment will be structured will be detailed in the introductory document for the subject, which can be found in the resources section of the virtual campus. As an indication, each type of exercise will compute the following percentage in the final grade:

- Partial 1, from 30 to 40%. It will include part 1, both theory and practice.
- Partial 2, from 30 to 40%. It will include part 2, both theory and practice.
- Memories and presentations of the activities of the computer classroom, seminars and lab sessions, from 20 to 30%.

To pass the subject, all the following conditions must be met:

- Overall mark greater than 5
- Weighted average mark of partials greater than 5 and minimum mark of each partial superior to 4.

Bibliografía y recursos de información

Principles of Proteomics; Edition:2nd; Author(s):Richard Twyman; ISBN:9780815344728; Publication Date:September 15, 2013

Biochemistry / Jeremy M. Berg, John L. Tymoczko, Gregory J. Gatto, Jr., Lubert Stryer; Publicació/producció New York : W.H. Freeman, cop. 2015; Edición Eighth edition; ISBN 9781464126109

Introduction to protein structure; Branden, Carl New York : Garland, cop. 1999

Futher bibliography will be indicated in presentations
